### Abstract

This study was conducted in order to determine the time management skills of İnönü University Faculty of Engineering Mechanical Engineering students. The study's universe constitutes 450 students studying Mechanical Engineering at İnönü University Faculty of Engineering in 2016-2017 academic year. A 15-question survey was applied to the collection of data. A survey based on a 3-point Likert scale was administered to the students and the reliability of the statistical analyses was done according to the repeat test repeat method. In the study, it was observed that students often did not do well in the first years of the university. However, in Years 3 and 4 it seems that they are sufficiently effective in time management. However, in the third and fourth grades they seem to be sufficiently effective in time management. In the conclusion section, the shortcomings of time management and the necessary things to be done are explained.
