### Abstract

WPP test was translated into Turkish in the study, which started as a scientific research project at the University, and was controlled by Turkish lecturers; and the Turkish form was back-translated into English. The form was finalized according to opinions of the specialists. Professional form was applied to 180 young individuals with mental disabilities at vocational schools in provinces of Bolu and Düzce. Varimax vertical rotation, principal components analysis and single factorial analysis were applied in the analysis of data. The original application of the form has five sub-scales. The WPP test was collected under a single factor in the analyses. Factors were found to be associated and reliability was found as .99.
