Abstract

The study aims to make validity and reliability studies scale attachment styles with mothers measure according to Bartholomew and Horowitz's Four Category Model for middle schools students. The scale is based self-report on the five point likert type. Sample of the study is consist 860 students in Pendik. As a result of factor analyses scale of 54 items was determined had four factor; explained %68,529 at the total variance (min: %5,898; max: %39,924). As a result of reliability analyses Alpha coefficient was found to vary between ,941 and ,977. All values for item total and item reminder analyses were found to be significant at ,001 level and also all the items and factors were descriptive. Test-retest correlations were significant. It was seen that the scale of the study could be as a reliable scale for middle school students.

Keywords: Attachment, attachment styles, attachment styles with mother, scale development.
