Abstract

The main purpose of this research has examining the academic achievements of conservator students through various variables. For this purpose, 94 students studying at Bülent Ecevit University State Conservatory, have formed the study group of the research. The frequency and percentage distributions of the data were tabulated and the relationships between the variables were calculated by the t test and ANNOVA. SPSS 19 package program was used for the analysis of the obtained data, and the difference between the two group averages was determined by t test. At the end of the research, it was determined that there is no significant relationship between the academic achievement scores of the conservator students and their genders, graduated high school type and number of siblings. Class levels, age, opportunities for shelter, income level variables and academic achievement were found to have significant relationships.
