### **Abstract**

Every occupation has its own sort of risks associated with it. Engineers who study in Engineering Faculties should be aware of these risks that may be caused by their jobs as well as they should be knowledgeable and conscious. In this study, a group of students at Harran University have been selected in order to fill out a survey. Then, the results of this survey was evaluated meticulously. In addition, the information of these students about the occupational health and safety was assessed. To large extent, we investigated how knowledgeable and conscious these students are about the occupational health and safety throughout their educational life at faculties. We took a sample of 450 students who are juniors and seniors in Engineering Departments so as to apply the survey. In this research, we come to conclusion based upon the purpose, method, and hypothesis. Finally, it was clearly observed that students do not have sufficient information about occupational health and safety. Depending on our findings, results are discussed, and some suggestions were advised.
